Washington Water Supply Out

JUNE 1, 1986

Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are termed reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. Because of the limited space, snow survey measurements are not published in monthly reports. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado (New Mexico)	2490 West 26th Ave., Denver, CO 80211
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715
Nevada	50 South Virginia Street, Third Floor, Reno, NV 89505
Oregon	1220 Southwest 3rd Ave., 16th Floor, Portland, OR 97204
Utah	4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147
Washington	360 U.S. Court House, Spokane, WA 99201
Wyoming	Federal Building, 100 East "B" Street, Casper, WY 82602

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 547, Portland, OR 97209.

GENERAL OUTLOOK

SUMMARY:

THIS IS THE FINAL WATER SUPPLY OUTLOOK REPORT OF THE SEASON, NEXT REPORT JANUARY 1987. With only a few manual snow courses read the 1st of June the SNOTEL sites give most of our snow information. Sixteen of the 34 sites were bare of snow on June 1. Paradise with 51 inches of water content had the most snow. Reservoir storage continues to be near normal. Precipitation was good over most of the state. Temperatures were below normal during the early part of May then above average for the last week.

SNOWPACK:

Above average temperatures for the last week in May accelerated the melt of the snow pack. Snow has melted from 16 of the 34 SNOTEL sites in Washington compared to last year when 20 sites were bare. There were 19 manual snow courses read this month with this small amount of courses few conclusions can be drawn.

PRECIPITATION:

The month of May had varied precipitation over Washington. The west and southeast were above normal while the eastern and central part were below normal. The Olympic Basin was at 209% of average with the north Puget Sound at 160%. The Okanogan area had 35% of normal precipitation while the Colville-Pend Oreille had 68%. The Yakima Basin was at 186% of average.

RESERVOIRS:

Stored irrigation water supplies are near average for June 1. The Yakima Basin has 937,600 acre-feet in the five major reservoirs which is average for June 1. Chelan Lake is at 133% of normal; Coeur d' Alene Lake is at 96%, and the Okanogan storage is at 99%. FDR lake is at 121% of average and the north Puget storage is at 112%.

STREAMFLOW:

Streamflow was near average in Washington rivers during May. The Chehalis River with 157% of average was the highest while the Spokane River with 55% was the lowest. Some flooding was experienced along the Okanogan River during the last of May; flooding was contained in the lowlands with only minor damages to homes. Streamflows were high during the last week of May as the warm weather melted the remaining snow.

SPOKANE RIVER BASIN

WATER SUPPLY OUTLOOK:

Reservoir storage in Coeur d' Alene Lake is near average at 96%. Only one snow course was read in the basin this month and that showed 52% of normal. Streamflow in the Spokane River was 55% of normal for May, and the May-September flows are forecasted to be 52% of average. Temperatures averaged 1 degree above normal with the last week of May outweighing the much cooler first two weeks of the month.

COLVILLE - PEND OREILLE RIVER BASINS

WATER SUPPLY OUTLOOK:

The Bunchgrass SNOTEL site was bare of snow on June 1. The last week in May saw nearly one foot of snow water leave the site. Streamflows in the basin for May were as follows: the Pend Oreille 74%, Kettle River 97% and the Columbia River at the International Boundary 90%. Precipitation for May was 68% of average bringing the year to date total down to 96% of average. Streamflows for May-July are forecast to be 79% on the Kettle River, 65% on the Colville and 66% on the Pend Oreille River.

For more information contact your local Soil Conservation Service office.

OKANOGAN - METHOW RIVER BASINS

WATER SUPPLY OUTLOOK:

Reservoir storage in the Okanogan Basin is near average. Precipitation for the Month of May was 35% of normal bringing the year to date to 82% of average. There were eight manual snow courses read in the Okanogan Basin for the June 1. Snow cover averaged 92% of normal. These courses were in the Canadian part of the basin. Streamflows during the last week of May were at flood stage on the Okanogan River. For May the flow averaged 98% for the Okanogan and 97% on the Similkameen.

For more information contact your local Soil Conservation Service office.

WHITE - GREEN RIVER BASINS

WATER SUPPLY OUTLOOK:

Precipitation for May was 149% of average in the Green-White River Basins. Forecasted streamflow remains below normal with 70% forecast for the Green River and 73% on the Cedar River. The year to date precipitation is 93% of normal.

For more information contact your local Soil Conservation Service office.

NORTH PUGET SOUND RIVER BASINS

WATER SUPPLY OUTLOOK:

There were no manual snow courses read for the June 1 reporting period. The Harts Pass SNOTEL site has 29.1 inches of water content remaining on the pillows as of the June 1. Precipitation for the month of May averaged 160% of normal bringing the water year to date to 107% of average. Streamflow for May was 82% of normal on the Skagit River. Forecasted streamflow for the Skagit River for the May-July period is 80% of average. Reservoir storage in Ross is 112% of normal for June 1.

OLYMPIC PENINSULA RIVER BASINS

WATER SUPPLY OUTLOOK:

Forecasts of streamflow for the Olympic Peninsula Rivers is much the same as last month at 72-73% for the May-July period. Precipitation for May was 209% of average with the Quillayute WSO reporting 11.02 inches. The water year to date total is 95% of average. All snow has left the Carrol Pass snow pillow.

For more information contact your local Soil Conservation Service office.

CONSERVE YOUR IRRIGATION WATER

Can irrigators use less water and get good yields? We think so. With energy costs on an upward spiral and water shortages likely, we offer these water saving ideas to irrigators.

Consider ditch lining or gated pipe. This will reduce the 10-90 percent loss which occurs in each ditches.

Keep ditches clean and free from weeds, sediment, or other debris, which can slow water velocity, affect delivery rate, and increase evaporation.

Make sure headgates, drop structures, and pipe inlets are operational. A washed-out structure is water lost.

Inspect ditchbanks for rodent damage. Rodent holes cause leakage or failures.

Make sure sprinkler nozzles aren't worn or leaky. Check pipe connections and valves to prevent leaks.

Operate sprinklers at recommended pressure to effectively use available water.

Maintain your pump at peak efficiency to save energy.

BETTER WATER MANAGEMENT

Better water management may require more labor. It may require changing a head of water in the middle of the night. But it will be worth it. You should:

Measure your water to determine how much is applied.

Consider alternate row irrigation for crops planted in furrows.

Plan short runs. Match stream size and velocity to soil intake rate and capacity.

Catch and reuse tail water.

Underirrigate the lower end of field to stretch your water.

And when water is short, consider eliminating that last irrigation.

Soil Conservation Service personnel can:

Help plan and design new irrigation systems or evaluate existing ones.

Provide technical assistance for land leveling, pipeline installation, and other practices.

KNOW YOUR SOIL

Soil absorbs irrigation water at a given rate. This varies with each soil type. Some crops require more water than others. Check soil moisture by spade, probe, or moisture meter. Or use the "feel" method.

WHEN IRRIGATION IS NEEDED, SOIL WILL FEEL AND ACT THIS WAY

Soil Texture	A handful of soil will
Coarse	Tend to stick together slightly, but will not form a ball.
Medium	Be crumbly, but will form a ball.
Fine	Be pliable, and will form a ball.

If you have a conservation plan on your farm, or if the soil in your area has been mapped, the Soil Conservation Service can crosscheck soil type and irrigation data and provide you with the water holding capacity of your soil for a given crop.

Snow Survey data can be obtained by calling one of the following local SCS offices:

The Following Organizations Cooperate With The Soil Conservation Service In Snow Survey Work

- Canada:** Ministry of the Environment, Water
Investigations Branch, Victoria, British Columbia
- States:** Washington State Department of Ecology
Washington State Department of Natural Resources
- Federal:** Department of the Army
Corps of Engineers
U.S. Department of Agriculture
Forest Service
U.S. Department of Commerce
NOAA, National Weather Service
U.S. Department of the Interior
Bonneville Power Administration
Bureau of Reclamation
Geological Survey
National Park Service
Bureau of Indian Affairs
- Local:** City of Tacoma
City of Seattle
Chelan County P.U.D.
Pacific Power and Light Company
Puget Sound Power and Light Company
Washington Water Power Company
Snohomish County P.U.D.
- Private:** Okanogan Irrigation District
Wenatchee Heights Irrigation District
Newman Lake Homeowners Association

Other organizations and individuals furnish valuable information for snow survey reports. Their cooperation is gratefully acknowledged.
